    return below(hi, p) && above(lo, p);
}

```

## Triângulo

**Baricentro** (centro de massa), ponto de interseção entre as três medianas(segmentos de reta que unem um vértice ao ponto médio do lado oposto). Divide cada mediana na proporção de 2:1. As coordenadas são a média aritmética entre as coordenadas dos vértices.

O **ortocentro** de um triângulo é o ponto de encontro de suas três alturas(reta passando por um vértice e perpendicular ao lado oposto). O ortocentro pode mesmo estar fora do triângulo (no caso de um obtusângulo). No caso de um triângulo retângulo, o ortocentro sempre coincide com o vértice oposto à hipotenusa.

O simétrico do ortocentro em relação a qualquer um dos lados pertence ao circuncírculo. O simétrico do ortocentro em relação a qualquer uma das medianas dos lados do triângulo também encontra-se sobre o circuncírculo. Sendo H o ortocentro e O o circuncentro do triângulo ABC, o ângulo ABH = OAC.

O **incentro** de um triângulo é o ponto de encontro de suas bissetrizes (retas que dividem um ângulo interno na metade). Além de ser sempre um ponto interior do triângulo, o incentro é o centro do círculo inscrito no triângulo, isto é, o maior círculo que cabe dentro do triângulo e que toca todos os seus três lados (os lados são tangentes ao círculo inscrito).

O raio do círculo inscrito é dado pela razão entre o dobro da área e o perímetro. As coordenadas do centro O do círculo inscrito são obtidas pela média ponderada das coordenadas x e y pelos comprimentos dos lados opostos. As fórmulas abaixo sintetizam estas afirmações  $p = a + b + c$ .

$$r = \frac{2A}{p}, Ox = \frac{a \cdot Ax + b \cdot Bx + c \cdot Cx}{p}, Oy = \frac{a \cdot Ay + b \cdot By + c \cdot Cy}{p}$$

O **circuncentro** é o ponto de encontro entre as retas bissetoras perpendiculares (isto é, retas perpendiculares aos lados do triângulo que os interceptam nos pontos médios). O cir-

cuncentro é o centro do círculo circunscrito do triângulo, isto é, o círculo que passa pelos três vértices do triângulo.

O circuncentro, assim como o ortocentro, pode estar localizado do lado externo do triângulo. Um caso especial interessante é o do triângulo retângulo, onde o circuncentro se localiza no ponto médio da hipotenusa.

O raio do circuncentro é dado pela razão entre o produto das medidas de seus lados e o quádruplo de sua área. As coordenadas do circuncentro podem ser determinadas pelas expressões abaixo, onde  $|A|^2 = Ax^2 + Ay^2$ , ou  $A * A$ .

$$r = \frac{abc}{4A}, S_x = \frac{1}{2d} * \begin{vmatrix} |A|^2 & A_y & 1 \\ |B|^2 & B_y & 1 \\ |C|^2 & C_y & 1 \end{vmatrix}, S_y = \frac{1}{2d} * \begin{vmatrix} A_x & |A|^2 & 1 \\ B_x & |B|^2 & 1 \\ C_x & |C|^2 & 1 \end{vmatrix}$$

$$d = \begin{vmatrix} A_x & A_y & 1 \\ B_x & B_y & 1 \\ C_x & C_y & 1 \end{vmatrix}$$

$|A|^2$  é dot product do vetor A com si mesmo.

## Miscellaneous

### LIS

```
